1 PROBLEM

To what point must the origin be moved in order that the equation

$$\mathbf{x}^T \begin{pmatrix} 1 & 2 \\ 2 & -2 \end{pmatrix} \mathbf{x} + (10 \quad -4) \mathbf{x} = 0 \quad (1.0.1)$$

may become

$$\mathbf{x}^T \begin{pmatrix} 1 & 2 \\ 2 & -2 \end{pmatrix} \mathbf{x} = 1 \quad (1.0.2)$$

and through what angle must the axes be turned in order to obtain

$$\mathbf{x}^T \begin{pmatrix} p & 0 \\ 0 & q \end{pmatrix} \mathbf{x} = 1 \quad (1.0.3)$$

2 EXPLANATION

The general second order equation can be expressed as follows,

$$\mathbf{x}^T \mathbf{V} \mathbf{x} + 2\mathbf{u}^T \mathbf{x} + f = 0 \quad (2.0.1)$$

Comparing (1.0.1) with (2.0.1),

$$\mathbf{V} = \begin{pmatrix} 1 & 2 \\ 2 & -2 \end{pmatrix} \quad (2.0.2)$$

$$\mathbf{u} = \begin{pmatrix} 5 \\ -2 \end{pmatrix} \quad (2.0.3)$$

$$f = 0 \quad (2.0.4)$$

Let the point to which the origin is moved be \mathbf{c} . The above equation (2.0.1) can be modified as

$$(\mathbf{x} + \mathbf{c})^T \mathbf{V} (\mathbf{x} + \mathbf{c}) + 2\mathbf{u}^T (\mathbf{x} + \mathbf{c}) = 0 \quad (2.0.5)$$

From equation (2.0.5) consider,

$$\Rightarrow (\mathbf{x} + \mathbf{c})^T \mathbf{V} (\mathbf{x} + \mathbf{c}) \quad (2.0.6)$$

$$\Rightarrow \mathbf{x}^T \mathbf{V} \mathbf{x} + \mathbf{c}^T \mathbf{V} \mathbf{x} + \mathbf{x}^T \mathbf{V} \mathbf{c} + \mathbf{c}^T \mathbf{V} \mathbf{c} \quad (2.0.7)$$

$$\Rightarrow \mathbf{x}^T \mathbf{V} \mathbf{x} + 2\mathbf{c}^T \mathbf{V} \mathbf{x} + \mathbf{c}^T \mathbf{V} \mathbf{c} \quad (2.0.8)$$

Substituting (2.0.8) in equation (2.0.5)

$$\Rightarrow \mathbf{x}^T \mathbf{V} \mathbf{x} + 2\mathbf{c}^T \mathbf{V} \mathbf{x} + \mathbf{c}^T \mathbf{V} \mathbf{c} + 2\mathbf{u}^T (\mathbf{x} + \mathbf{c}) = 0 \quad (2.0.9)$$

Comparing equations (2.0.9) and (1.0.2), we can write as,

$$\Rightarrow 2\mathbf{c}^T \mathbf{V} \mathbf{x} + 2\mathbf{u}^T \mathbf{x} = 0 \quad (2.0.10)$$

$$\Rightarrow \mathbf{c}^T \mathbf{V} = -\mathbf{u}^T \quad (2.0.11)$$

$$\Rightarrow \mathbf{c} = -\mathbf{V}^{-1} \mathbf{u} = -\begin{pmatrix} \frac{1}{3} & \frac{1}{3} \\ \frac{1}{3} & -\frac{1}{6} \end{pmatrix} \begin{pmatrix} 5 \\ -2 \end{pmatrix} \quad (2.0.12)$$

$$\Rightarrow \mathbf{c} = \begin{pmatrix} -1 \\ -2 \end{pmatrix} \quad (2.0.13)$$

From (2.0.13), when the origin is moved to point \mathbf{c} , the equation (1.0.1) becomes (1.0.2).

From equations (1.0.1) and (2.0.13), \mathbf{V} doesn't change

$$\det(\mathbf{V}) = -6 \quad (2.0.14)$$

Since $\det(\mathbf{V}) < 0$ the given equation represents the hyperbola

From equation (1.0.2), the equation is of the form,

$$\mathbf{x}^T \mathbf{V} \mathbf{x} + f = 0 \quad (2.0.15)$$

The matrix \mathbf{V} can be decomposed as,

$$\mathbf{V} = \mathbf{P} \mathbf{D} \mathbf{P}^T \quad \mathbf{D} = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \quad (2.0.16)$$

where λ_1 and λ_2 are Eigen values of \mathbf{V} , and \mathbf{P} contains the Eigen vectors corresponding to the Eigen values λ_1 and λ_2 . The affine transformation is given by,

$$\mathbf{x} = \mathbf{P}\mathbf{y} + \mathbf{c} \quad (2.0.17)$$

where, \mathbf{P} indicates the rotation of axes and \mathbf{c} indicates the shift of origin.

Eigen values of \mathbf{V} are,

$$|\lambda \mathbf{I} - \mathbf{v}| = 0 \quad (2.0.18)$$

$$\Rightarrow \begin{vmatrix} \lambda - 1 & -2 \\ -2 & \lambda + 2 \end{vmatrix} = 0 \quad (2.0.19)$$

$$\Rightarrow \lambda^2 + \lambda - 6 = 0 \quad (2.0.20)$$

$$\Rightarrow \lambda_1 = -3, \lambda_2 = 2 \quad (2.0.21)$$

$$\mathbf{D} = \begin{pmatrix} -3 & 0 \\ 0 & 2 \end{pmatrix} \quad (2.0.22)$$

Eigen vector for $\lambda_1 = -3$,

$$\lambda_1 \mathbf{I} - \mathbf{v} = \begin{pmatrix} -4 & -2 \\ -2 & -1 \end{pmatrix} \xrightarrow{R_2 \leftarrow R_2 - \frac{R_1}{2}} \begin{pmatrix} -2 & -1 \\ 0 & 0 \end{pmatrix} \quad (2.0.23)$$

$$\Rightarrow \mathbf{P}_1 = \begin{pmatrix} 1 \\ -2 \end{pmatrix} = \begin{pmatrix} \frac{1}{\sqrt{5}} \\ \frac{-2}{\sqrt{5}} \end{pmatrix} \quad (2.0.24)$$

Eigen vector for $\lambda_2 = 2$,

$$\lambda_2 \mathbf{I} - \mathbf{v} = \begin{pmatrix} 1 & -2 \\ -2 & 4 \end{pmatrix} \xrightarrow{R_2 \leftarrow R_2 + 2R_1} \begin{pmatrix} 1 & -2 \\ 0 & 0 \end{pmatrix} \quad (2.0.25)$$

$$\Rightarrow \mathbf{P}_2 = \begin{pmatrix} 2 \\ 1 \end{pmatrix} = \begin{pmatrix} \frac{2}{\sqrt{5}} \\ \frac{1}{\sqrt{5}} \end{pmatrix} \quad (2.0.26)$$

$$\mathbf{P} = \begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \\ \frac{-2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \quad (2.0.27)$$

Therefore \mathbf{V} can be written as,

$$\mathbf{V} = \begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \\ \frac{-2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \begin{pmatrix} -3 & 0 \\ 0 & 2 \end{pmatrix} \begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{5}} \\ \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \quad (2.0.28)$$

Equation (1.0.2) can be written as,

$$\mathbf{x}^T \left[\begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \\ \frac{-2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \begin{pmatrix} -3 & 0 \\ 0 & 2 \end{pmatrix} \begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{5}} \\ \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \right] \mathbf{x} = 1 \quad (2.0.29)$$

$$\left[\begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{5}} \\ \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \mathbf{x} \right]^T \begin{pmatrix} -3 & 0 \\ 0 & 2 \end{pmatrix} \left[\begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{5}} \\ \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \mathbf{x} \right] = 1 \quad (2.0.30)$$

Consider the rotation transformation

$$\mathbf{x} = \mathbf{P}\mathbf{y} \quad (2.0.31)$$

$$\Rightarrow \mathbf{x} = \begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} \\ \frac{-2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \mathbf{y} \quad (2.0.32)$$

$$\mathbf{P}^{-1}\mathbf{x} = \mathbf{P}^{-1}\mathbf{P}\mathbf{y} \quad (2.0.33)$$

$$\Rightarrow \mathbf{y} = \mathbf{P}^{-1}\mathbf{x} \quad (2.0.34)$$

$$\text{But, } \mathbf{P}^{-1} = \mathbf{P}^T \quad (2.0.35)$$

$$\Rightarrow \mathbf{y} = \begin{pmatrix} \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{5}} \\ \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{5}} \end{pmatrix} \mathbf{x} \quad (2.0.36)$$

Using (2.0.36) in (2.0.30), the equation can be rewritten as

$$\mathbf{y}^T \begin{pmatrix} -3 & 0 \\ 0 & 2 \end{pmatrix} \mathbf{y} = 1 \quad (2.0.37)$$

Equation (2.0.37) is same as (1.0.3) with $p=-3$ and $q=2$.

From equation (2.0.27), the orthogonal matrix represents the rotation matrix in form of,

$$\mathbf{P} = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \quad (2.0.38)$$

Comparing (2.0.27) and (2.0.38),

$$\cos \theta = \frac{1}{\sqrt{5}} \quad (2.0.39)$$

$$\Rightarrow \boxed{\theta = 63.43^\circ} \quad (2.0.40)$$

From equation (2.0.38), if the axes is turned by θ then the equation obtained would be (1.0.3).
