1 PROBLEM

Let \mathbf{A} be an $m \times n$ matrix of rank m with $n > m$. If for some non-zero real number α , we have $\mathbf{x}^T \mathbf{A} \mathbf{A}^T \mathbf{x} = \alpha \mathbf{x}^T \mathbf{x}$, for all $x \in \mathbf{R}^m$, then $\mathbf{A}^T \mathbf{A}$ has,

1. exactly two distinct eigenvalues.
2. 0 as an eigenvalue with multiplicity $n - m$.
3. α as a non-zero eigenvalue.
4. exactly two non-zero distinct eigenvalues.

2 EXPLANATION

Refer Table 0.

3 SOLUTION

Refer Table 1.

| Given | Derivation |
|--|---|
| Given | <p>\mathbf{A} is a $m \times n$ matrix of rank m with $n > m$. A non-zero real number α. To find eigenvalues of $\mathbf{A}^T \mathbf{A}$.</p> |
| Eigenvalues of $\mathbf{A} \mathbf{A}^T$ | <p>$\mathbf{A} \mathbf{A}^T$ is a $m \times m$ matrix and $\mathbf{A}^T \mathbf{A}$ is a $n \times n$ matrix. Let, λ be a non-zero eigen value of $\mathbf{A}^T \mathbf{A}$.</p> $\mathbf{A}^T \mathbf{A} \mathbf{v} = \lambda \mathbf{v} \quad \mathbf{v} \in \mathbf{R}^n \quad (2.0.1)$ $\mathbf{A} \mathbf{A}^T \mathbf{A} \mathbf{v} = \lambda \mathbf{A} \mathbf{v} \quad (2.0.2)$ <p>Let, $\mathbf{x} = \mathbf{A} \mathbf{v} \quad \mathbf{x} \in \mathbf{R}^m \quad (2.0.3)$</p> $\mathbf{A} \mathbf{A}^T \mathbf{x} = \lambda \mathbf{x} \quad (2.0.4)$ $\mathbf{x}^T \mathbf{A} \mathbf{A}^T \mathbf{x} = \lambda \mathbf{x}^T \mathbf{x} \quad (2.0.5)$ <p>Given, $\mathbf{x}^T \mathbf{A} \mathbf{A}^T \mathbf{x} = \alpha \mathbf{x}^T \mathbf{x} \quad (2.0.6)$</p> $\implies \alpha \mathbf{x}^T \mathbf{x} = \lambda \mathbf{x}^T \mathbf{x} \quad (2.0.7)$ <p>From equation (2.0.7), $\lambda = \alpha$ as $\ \mathbf{x}\ \neq 0$ $\mathbf{A}^T \mathbf{A}$ has an eigenvalue α with multiplicity m.</p> |
| Eigenvalues of $\mathbf{A}^T \mathbf{A}$ | <p>$\mathbf{A}^T \mathbf{A}$ is a $n \times n$ matrix. Given $n > m$,</p> <p>We know that, $\mathbf{A}^T \mathbf{A}$ and $\mathbf{A} \mathbf{A}^T$ have same number of non-zero eigenvalues and if one of them has more number of eigenvalues than the other then these eigenvalues are zero.</p> <ol style="list-style-type: none"> 1. From above, as α is non-zero, $\mathbf{A}^T \mathbf{A}$ has α as its eigenvalue with multiplicity m 2. $\mathbf{A}^T \mathbf{A}$ has 0 as its eigenvalue with multiplicity $n - m$ 3. Therefore, the two distinct eigenvalues of $\mathbf{A}^T \mathbf{A}$ are α and 0. |

TABLE 0: Explanation

| | |
|--|-----------------|
| $\mathbf{A}^T \mathbf{A}$ has exactly two distinct eigenvalues. | True statement |
| $\mathbf{A}^T \mathbf{A}$ has 0 as an eigenvalue with multiplicity $n - m$ | True statement |
| $\mathbf{A}^T \mathbf{A}$ has α as a non-zero eigenvalue | True statement |
| $\mathbf{A}^T \mathbf{A}$ has exactly two non-zero distinct eigenvalues. | False statement |

TABLE 1: Solution
